

# **Beekeeping short-course**

## **Visual aids (photos)**

The photos of comb below can be printed out and taped or stapled to topbars to demonstrate dry-runs of comb management techniques in the classroom prior to actual field demonstrations. You might want to cut them into trapezoidal shapes typical of what will be found inside the KTBH. As contained herein the comb photos (which can be printed out as double-sided prints and laminated for greater durability) are intended to represent both faces of ten combs, enough to realistically represent a small colony.

The photos at the end can be printed out to draw out from trainees the differences between the castes and to point out typical behaviours of each caste (except for the swarm photo I've tried to retain the relative sizes for each caste upon print out). The drawings can be similarly used to explain the life stages and the value of bees as pollinators.
